## Uobičajene neželjene posljedice pojavljuju se ubrzo nakon vakcinacije i traju 1 do 2 dana

### Vakcinacija može izazvati sljedeće reakcije:

Blago povišena temperatura (<38.5 °C) koja ne traje dugo

Plaćljivo, uznemireno, neraspoloženo ili pospano dijete

Na mjestu injekcije: bol, crvenilo, peckanje, svrab ili naticanje koje traje 1-2 dana i/ili mala tvrda kvrga koja traje nekoliko sedmica

### Šta treba uraditi kod kuće:

Ako dojenče/dijete ima temperaturu, nemojte mu oblačiti previše odjeće ili ga pokrivati s previše deka. Može mu se dati paracetamol (provjerite uputstva na etiketi).

Dojite češće i/ ili dajte bebi više tekućine

Stavite mokar hladan oblog na mjesto injekcije.

### Kada treba tražiti savjet ljekara:

Ako bolovi i temperatura ne popuste od paracetamola (npr. panadol®).

Ako reakcije ne prestaju ili ako se pogoršavaju ili ako ste imalo zabrinuti, otidite svom ljekaru ili u bolnicu.

## Vrlo rijetke neželjene pojave od vakcine koje zahtijevaju hitnu medicinsku intervenciju

- Febrilne konvulzije: uzrokovane visokom temperaturom, koja se obično javlja kod djece mlađe od 3 godine.
- Beba iznenada problijedi, omlitavi i ne reaguje u trajanju od 1 do 48 sati nakon vakcinacije. Ubrzo nakon toga beba se potpuno oporavi.
- Začepljenje crijeva (intususcepција): nastupi kada dio debelog crijeva sklizne u sljedeći dio, kao dijelovi teleskopa. Ovo se može dogoditi kod bebe u roku od 7 dana nakon primanja prve i druge doze vakcine protiv rotavirusa.

Znaci začepljenja crijeva uključuju:

- napade plača
  - bljedilo
  - skupljanje nogu prema trbuhi.
- Upala živca ruke (brahijalni neuritis): izaziva osjećaj slabosti ili utrnutosti u ruci.
  - Teška alergijska reakcija (anafilaksija) koja iznenada nastupi, obično u roku od 15 minuta od primanja vakcine, ali može nastupiti i u roku od nekoliko sati od vakcinacije. Rani znaci anafilaksije uključuju:
    - crvenilo ili svrab kože
    - probleme s disanjem
    - osjećaj uznemirenosti.
  - Guillain-Barre sindrom: uzrokuje širenje paralize i ponekad ukočenost. Ranije se povezivao s vakcinom protiv gripe iako rijetko ili nikako.

**Za ozbiljne ili neočekivane neželjene efekte nakon imunizacije kontaktirajte Viktorijsku službu za sigurnost vakcine (Victorian vaccine safety service) na 1300 882 924 / saefvic@mcri.edu.au / www.saefvic.org.au  
Ova služba ne pruža hitnu pomoć za neželjeni efekt.**

**Prevodilačka služba. Nazovite 131 450**

**Za više informacija:** Obratite se svom ljekaru ili lokalnoj općinskoj službi za imunizaciju.

## Common side effects occur soon after vaccination and last 1 to 2 days

### Vaccinations may cause the following reactions:

Mild fever (<38.5 °C) that doesn't last long

Grizzly, unsettled, unhappy or sleepy

Where the needle was given: Sore, red, burning, itching or swelling for 1-2 days and/or small hard lump for a few weeks

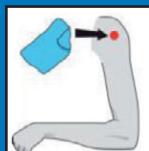

### What to do at home:

If baby/child has a fever do not have too many clothes or blankets on. Paracetamol can be given (check the label for correct use).

Breast feed more frequently and/or give extra fluids

Put a cold wet cloth on the injection site.

### When to seek medical advice:

If pain and fever are not relieved by paracetamol (eg. Panadol<sup>®</sup>).

If the reactions are not going away or getting worse or if you are worried at all, then see your doctor or go to hospital.

## Very rare vaccine side effects requiring immediate medical attention

- Febrile convulsion: caused by a high fever, generally occurs in children under 3 years of age.
- The baby suddenly becomes pale, limp and unresponsive from 1 to 48 hours after vaccination. Soon after the baby fully recovers.
- Bowel blockage (intussusception): occurs when a portion of the bowel slides into the next, like the pieces of a telescope. This can occur in a baby in the 7 days following the 1st and 2nd dose of rotavirus vaccine.  
Signs of bowel blockage include:
  - bouts of crying
  - pale appearance
  - pulling the legs up to the stomach.
- Inflammation of a nerve in the arm (Brachial neuritis): causes a feeling of weakness or numbness in the arm.
- A severe allergic reaction (anaphylaxis) occurring suddenly, usually within 15 minutes of vaccine administration but can occur within hours of administration. Early signs of anaphylaxis include:
  - redness and or itching of the skin
  - breathing problems
  - a sense of distress.
- Guillain-Barre syndrome: causes ascending paralysis and sometimes numbness. In the past it has been linked with influenza vaccine either rarely if at all.

**For significant or unexpected side effects following immunisation, you can contact the Victorian vaccine safety service on 1300 882 924 / saefvic@mcri.edu.au / www.saefvic.org.au  
This service does not give immediate emergency management for a side effect.**

Translating and interpreting service. Call 131 450
