Decreased fetal movements

**Decreased Fetal Movements (DFM)**

**Cardiotocograph (CTG)**
Clinical assessment of fetal growth
Identify and document risk factors

**Normal CTG**

- **Normal fetal growth AND no risk factors**
  - Normal fetal movements resume
  - Continue routine antenatal care
  - Advise to return if DFM recurs

- **DFM persist or repeat presentation**
  - Escalate for immediate obstetric review
  - Consider delivery
  - Refer for ultrasound (US) within 24 hours

**Abnormal CTG**

- **Suspected Fetal Growth Restriction (FGR) AND/OR risk factors**
  - Abnormal US
    - Investigate for presence of feto-maternal haemorrhage (FMH): individualise management as results indicate

- **Normal US**
  - Individualise management as US findings indicate

Consider delivery if:
DFM persists or recurs or there are any abnormal findings
